

BDF200 & BDF100 Modular Control Stations

Overview

The BDF series control stations are designed to offer various machine or process controls conveniently located at the guard door in one compact, easy to install housing. The BDF series eliminates the need for larger custom control boxes to be designed and manufactured for guard door controls.

The BDF200 control station can include operators in up to 4 positions; The BDF100 is a single position version. They can be configured from a wide variety of operators such as emergency stop buttons (top position only), pushbuttons, illuminated pushbuttons, raised pushbuttons, selector and keyed selector switches, and pilot lights. This flexibility allows the BDF200 to be configured to user-defined application needs.

Operator Options

	B	Blank (position cover)
